

Sound (Elkonin) boxes are a fun, practical evidence-based way to help children hear every sound in a word and develop phonemic awareness.

The child says the word slowly, then repeats, moving a counter into a box for each phoneme as they slowly and clearly articulate it, working from left to right. If they finish and there is still an empty box, they know to go back and try again to hear the missing sound and fill in all the boxes with the counters.

Once the child can sound out the words correctly by pushing the counters, they can now try writing the letters (graphemes) for the sounds in the boxes to spell the word.
